It often happens that price for a product changes depending on its attributes, for example, size or weight. A customer chooses the type of product he needs, selects the appropriate parameters, adds the product to the cart. During this in the program vitruemart the product price on the page differs from the one in the cart. This confuses the customers.

Let's review the situation on an example. Let's suppose that we have an online shop of jewelry. The product is a golden ring with diamonds that costs 20452 roubles. We choose the size 16 – other 4 thousands roubles are added, 750 standard – other 2 thousands, then add the product to the cart and the price is 27952 roubles. The price on the page is former.

We offer to make such a change of virtuemart price so that the changes can be immediately viewed on product's page. The total final cost in this case will be shown yet at page's loading, if the current feature is not null. Also we won't make any changes to the code of the online shop, we'll limit ourselves with an is js file.

So the result should be (base price is 21 952,00 roubles):

```
//@author: http://bigemot.ru  window.addEvent('domready', function() {    var img=$$('.r_img img');  img.getParent().setStyles({'position': 'relative'});    for(var i=0; i
```
